The global Ferro-TiC Guide Rollers market size is predicted to grow from US\$ 837 million in 2025 to US\$ 1124 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Ferro-TiC guide rollers are wear-resistant guide rollers manufactured using a steel or iron-based alloy as the binder phase and hard phases such as titanium carbide or tungsten carbide as the reinforcing phase. Primarily utilized in production lines for rolled steel, wire rods, and structural steel, these rollers serve to guide, support, limit movement, and reduce friction for the workpieces being rolled.

The upstream supply chain encompasses iron powder, alloy powders, titanium carbide, tungsten carbide, molybdenum, chromium, nickel, molds, sintering equipment, heat treatment equipment, and precision grinding machinery. The downstream market targets steel mills, rolling lines, metallurgical equipment manufacturers, and the spare parts and maintenance sector.

In the global market, the average unit price for steel-bonded cemented carbide guide rollers stands at approximately US\$460 per piece. Global sales volume is estimated at around 1.86 million units, with an annual production capacity ranging from 3 to 4 million units, and the industry maintains a profit margin of approximately 20%.

The future trajectory of the global market will center on advancements in high wear resistance, high toughness, extended service life, and customization tailored to specific operating conditions. As steel enterprises increasingly adopt high-speed continuous rolling processes, strive to minimize downtime for maintenance, and seek to enhance product dimensional precision, guide rollers are required to maintain stable performance

within environments characterized by high temperatures, impact loads, friction, and exposure to cooling media. Steel-bonded cemented carbide guide rollers uniquely combine the toughness inherent in a steel matrix with the wear resistance of hard phases, making them suitable replacements for certain conventional alloy steel, bearing steel, and traditional cemented carbide guide components. Future competitive efforts will focus primarily on material formulations, sintering density, the stability of heat treatments, the precision machining of groove profiles, and the capability to provide customized solutions that are optimally matched to the specific operating conditions of the rolling lines.
