The global Ferroboron Alloy market size is predicted to grow from US\$ 394 million in 2025 to US\$ 566 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global Ferroboron Alloy production reached approximately 114 k tons, with an average global market price of around US\$3,538 per ton. Ferroboron (FeB) is a ferroalloy consisting of iron and boron. The metal usually contains 17.5% to 20% boron and is used to produce boron steels. According to the carbon content, ferroboron (boron content: 5-25%) can be divided into low carbon (C?0.05%~0.1%, 9%~25%B) and medium carbon (C?2.5%, 4%~19 %B).

The global ferroboron alloy market is intrinsically linked to the steel and advanced manufacturing industries. Its current development is primarily driven by the steel sector, particularly the demand for high-strength, lightweight materials in the automotive industry. Evolving trends indicate a growing demand shift from traditional steelmaking towards expanding sectors like neodymium iron boron (NdFeB) permanent magnets, which are crucial for electric vehicles and wind power. Concurrently, geopolitical factors are prompting efforts, notably in the United States, to reshore critical supply chains including those for rare earth magnets, potentially altering global supply dynamics. The key market opportunity lies in the ongoing industrialization and infrastructure development in the Asia-Pacific region. However, the industry faces notable challenges: firstly, cost pressures from price volatility and geopolitical supply risks of raw materials like boron ore; secondly, competition from substitute alloying elements such as vanadium and molybdenum in certain applications; and thirdly, signs of capacity saturation and intense price competition in some downstream high-end material sectors, such as iron-based amorphous alloys.
