The global Ferrosilicon Aluminum market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Silicon aluminum iron alloy is a deoxidizer used in steelmaking production, which improves the morphology of inclusions and reduces the content of gas elements in molten steel. It is an effective new technology to improve steel quality, reduce costs, and save aluminum. For the production of silicon aluminum iron alloy, there are two types of raw material processing methods: ore reducing agent directly fed into the furnace after batching and first treated by pelletizing before being fed into the furnace.
