FESEM is a kind of electron microscope. This instrument has super high resolution, and can do secondary electron image, reflection electron image observation and image processing of various solid sample surface topography. Using the principle of secondary electron imaging, the instrument can observe biological samples such as tissues, cells, microorganisms and biological macromolecules on the nanometer scale under low voltage on the basis of coating or non-coating, so as to obtain a faithful image with a strong three-dimensional effect. The ultra-micro-morphological and structural information of the sample surface; it has a high-performance X-ray energy spectrometer, which can simultaneously perform qualitative, semi-quantitative and quantitative analysis of the micro-area point, line and surface elements on the sample surface, and has comprehensive analysis capabilities for morphology and chemical components.
