Fiber grating etching machine is a device used to manufacture gratings on the surface of the inner cladding of optical fibers. Grating is a periodic refractive index changing structure that can modulate the wavelength, phase, polarization and other properties of light. The principle of fiber grating etching machine is to use ultraviolet laser or chemical etching and other methods to write regular or irregular concave and convex textures on the surface of the inner cladding of the optical fiber, so that the cladding loses the laser transmission conditions, thereby realizing the stripping of cladding light. Purpose. Fiber grating etching machine is an important tool for making fiber gratings and is widely used in fiber lasers, fiber sensors, fiber communications and other fields.

The global Fiber Grating Etching Machine market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
