The report requires updating with new data and is sent in 48 hours after order is placed.

The fiber optic detector consists of a transmitter and a receiver. The light source adopts light emitting two-board tube (LED). The light beam reflected from the surface of the object is measured by the generating diode. Therefore, the distance between the detector and the object becomes a function of the illumination field of the transmitting fiber and the field of view of the receiving fiber. According to the different combination structure of reflecting and receiving fiber. The distance curve will form different basic characteristics, which can determine the nature of the measured surface.
