Fiber-optic indoor base stations are a type of communication base station system that uses optical fiber as the backbone transmission medium to transmit baseband signals or radio frequency signals from centralized equipment (such as BBU or main equipment) to radio frequency units (RRU or pRRU) distributed inside buildings. This type of base station is usually deployed in indoor areas with weak coverage, such as large venues, subways, and office buildings. It has the advantages of long transmission distance, strong anti-interference ability, and flexible networking, and can effectively improve the coverage quality and capacity of indoor mobile communication networks.
