Fiber-Reinforced Polymer for Ships is a composite material that uses fiber (such as glass fiber, carbon fiber, aramid fiber, etc.) as reinforcement material and polymer as matrix through a specific process. It is designed for use in the ship field. It combines the mechanical properties of fiber such as high strength and high modulus with the formability and corrosion resistance of the polymer matrix. Compared with traditional metal materials, it has many advantages such as light weight, high specific strength and specific stiffness, excellent corrosion resistance, strong designability, and flexible molding process. It can effectively reduce the weight of the hull, reduce energy consumption, increase speed and load capacity, and enhance durability. It can also be customized according to the structural and functional requirements of different parts of the ship. It is widely used in various ship components such as hull structure, superstructure, deck, cabin, mast, propulsion system components, etc. It is one of the key materials for achieving lightweight and high performance development in modern shipbuilding.

United States market for Fiber-Reinforced Polymers for Ships is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
