A Fiber Visual Fault Locator is a handheld diagnostic tool for fiber-optic systems that injects a visible red laser (typically 650 nm) into fiber to reveal breaks, bends, crimps, and poor splices. Unlike infrared communications signals, the VFL's visible output allows field technicians to visually identify fault points as glowing spots of scattered light, even through the fiber's jacket. VFLs operate in continuous or pulsed modes, offering variable output powers (typically 1–30 mW) to accommodate different testing distances up to ~30 km. Commonly featuring pen-style or rugged casing, they accept standard connectors (LC, SC, ST) and are powered by AAA/AA cells or built-in rechargeable batteries. VFLs are essential in telecom, enterprise, and data-center networks to confirm end-to-end continuity, identify faulty segments within OTDR dead zones, verify fiber polarity, and ensure proper connector cleanliness. They are prized for being simple, quick, and cost-effective, complementing more complex test equipment in fiber deployment and maintenance workflows.
