## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Fiberglass cooling towers are advanced, engineered structures designed to dissipate waste heat to the atmosphere through the evaporation of water. These towers are made primarily from glass fiber reinforced plastic (GFRP), which offers superior corrosion resistance and durability compared to other materials. They are an essential component in industrial processes, power generation, and HVAC systems, where they help maintain efficient heat exchange and prevent overheating of machinery and buildings. The water that circulates through the tower absorbs heat from the process, then releases it to the atmosphere via evaporation, effectively cooling the water and allowing it to be recirculated.

The global Fiberglass Cooling Towers market size is projected to grow from US\$ 3839 million in 2024 to US\$ 4931 million in 2030; it is expected to grow at a CAGR of 4.3% from 2024 to 2030.
