Fibreglass Assembled Roving refers to a bundle of continuous glass filaments that are gathered and lightly bound together without twisting. These rovings are manufactured by assembling multiple strands of glass fibers, which are then coated with a sizing agent to enhance compatibility with specific resins such as polyester, vinyl ester, or epoxy. The assembled roving is widely used as a reinforcement material in composite manufacturing processes, including filament winding, pultrusion, compression molding, and hand lay-up. It offers excellent mechanical strength, corrosion resistance, and dimensional stability, making it ideal for use in industries such as automotive, construction, marine, and wind energy.

Fibreglass Assembled Roving commonly features a linear density (tex) range from 300 to 4800 tex, with filament diameter typically between 13 μm and 17 μm . It exhibits tensile strength above 1200 MPa, and a moisture content below 0.10%, ensuring stability and resin compatibility during storage and processing. The sizing content generally falls between 0.4% and 1.2% by weight, with formulations optimized for specific resin systems such as polyester, vinyl ester, or epoxy. The roving provides good choppability, rapid wet-out, and low fuzz generation, making it suitable for various molding techniques including spray-up, SMC, RTM, and pultrusion. Packaging typically includes

rolls of 15–25 kg, with compatibility for automatic and manual processing lines.
