Fibrin sealant is a type of biological tissue adhesive used in medical and surgical procedures to promote hemostasis (the process of stopping bleeding) and to facilitate tissue adhesion and wound healing. It consists of two main components: fibrinogen and thrombin, which are derived from human or animal blood. When these components are mixed together and applied to a bleeding site or surgical area, they mimic the final stages of the blood clotting process, forming a stable fibrin clot that seals tissues, controls bleeding, and supports tissue regeneration. Fibrin sealants are commonly used in surgeries, trauma care, and dental procedures to reduce bleeding and enhance healing.
