Field control light sticks are a widely used audience interaction tool in large-scale events, especially in music festivals, concerts, sports events, fashion shows and other occasions. Field control light sticks are light sticks equipped with remote control sensors, which can be uniformly or partitioned controlled by signals transmitted by the central control console to achieve changes in color, brightness and flashing rhythm, thereby forming a complementary effect with stage lights, live sound effects, etc., and enhancing the visual effects and interactive atmosphere of the event.

The working principle of field control light sticks is based on wireless communication technology. The central control console sends signals in the form of RF broadcasts. After the remote control sensor inside the light stick receives the signal, it changes the color, brightness and flashing rhythm according to the instructions. This technology enables tens of thousands of light sticks in the venue to change uniformly with the changes in the color of the stage lights, and change the color and lighting rhythm of the light sticks as the music rhythm changes and the style of music changes.
