A filler masterbatch for blowing film is a concentrated additive formulation designed for incorporation into polymer resins during the production of blown plastic films. Comprising primarily of inorganic fillers (such as calcium carbonate, talc, or silica), a carrier resin compatible with the base polymer (e.g., LDPE, LLDPE, or HDPE), and functional additives (like dispersants, coupling agents, or processing aids), this masterbatch is engineered to enhance film properties while optimizing production costs. The fillers, typically accounting for 50–80% of the masterbatch by weight, are finely ground and uniformly dispersed in the carrier resin through compounding processes (e.g., twin-screw extrusion), ensuring homogeneous distribution in the blown film. By adjusting filler type and loading, the masterbatch can improve film stiffness, dimensional stability, and barrier properties, or reduce raw material costs without compromising processability during blow molding—where molten polymer is extruded into a tube, inflated, and cooled to form a thin film. Common applications include agricultural mulch films, packaging bags, stretch wraps, and industrial liners, where balanced mechanical performance and cost efficiency are critical.
