Aquaculture solid-liquid separation filter media are key functional materials applied to the front end of recirculating aquaculture systems. They are primarily used to intercept and separate feces, uneaten feed, and suspended solid particles from the water, achieving efficient separation of solid pollutants from the water phase. These filter media typically have a large specific surface area, good water permeability, and anti-clogging properties. They can significantly reduce the load on downstream biochemical filters and nitrification systems, and are a fundamental component in ensuring the stable operation of recirculating aquaculture systems, improving water quality, and increasing stocking density. In 2025, sales volume was 7,500 tons, with an average price of US\$5,500 per ton, a gross profit margin of 47%, and a total production capacity of 8,500 tons.
