Abstracts

The global Financial Modeling Service market size is predicted to grow from US\$ 872 million in 2025 to US\$ 1302 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

To address the problems of low efficiency, high model error risk, and insufficient support for complex business decisions in traditional financial analysis, financial modeling services have emerged. Since the late 20th century, with the integration of computing technology and financial engineering, financial modeling services have gradually evolved into a professional analysis support system covering multiple scenarios such as financial forecasting, valuation analysis, risk simulation, and investment optimization, deeply integrating industry standard models, customized algorithms, and artificial intelligence technologies. Currently, this service is widely used in areas such as corporate strategic planning, investment decision-making, risk management, and regulatory compliance, significantly improving the accuracy, efficiency, and strategic value of financial analysis, becoming one of the core tools for modern financial operations and decision-making.

Financial modeling services are developing towards intelligence, real-time processing, and universal accessibility. In the short term, large-scale AI models will deepen their application in scenarios such as intelligent investment advisory, anti-fraud, and credit approval; in the medium to long term, quantum computing may break through the computing power limitations of traditional models, and the combination of blockchain and digital currency will restructure the payment and settlement system. The industry needs to balance technological innovation with compliance risks, piloting new models through "regulatory sandboxes" while strengthening industry-academia-research collaboration to cultivate interdisciplinary talent, in order to cope with the financial

changes of the digital age.
