The global Fine Guide Star Sensor market size is predicted to grow from US$ 2050 million in 2025 to US$ 3179 million in 2031; it is expected to grow at a CAGR of 7.6% from 2025 to 2031.

The Fine Guidance Sensor is an interferometer mounted on the Hubble Space Telescope that provides a high precision pointing signal that is fed into the attitude control system during observation.

Fine guide star sensors are used primarily in ground-based and space-based telescopes to compensate for atmospheric turbulence and improve image quality. Fine guide star sensors are a critical component of adaptive optics systems, which adjust the telescope's mirrors in real time to counteract the blurring effects of the Earth's atmosphere. Fine guide star sensors enable high-resolution observations of celestial objects by minimizing the impact of atmospheric distortion, resulting in clearer and more detailed images. In some cases, fine guide star sensors work in conjunction with laser guide stars, where a laser beam creates an artificial guide star in the upper atmosphere for calibration.
