Alumina is a compound with high hardness. More than 90% of the alumina in the world is used as raw material for the production of metallic aluminum. This type is called metallurgical grade alumina. The rest we call fine alumina, which refers to the general name of special alumina, aluminum hydroxide and aluminum-containing compounds other than alumina for metallurgical purposes. Fine aluminum hydroxide is a branch of it. Fine aluminum hydroxide is a high-purity, high-quality aluminum hydroxide product that usually has a fine particle size and uniform particle morphology. Fine aluminum hydroxide is commonly used in various industrial applications such as catalysts, filler materials, ceramic materials, coatings, electronic materials, etc.
