A FinFET is a type of field-effect transistor (FET) that has a thin vertical fin instead of being completely planar. The gate is fully “wrapped” around the channel on three sides formed between the source and the drain. The greater surface area created between the gate and channel provides better control of the electric state and reduces leakage compared to planar FETs. Using FinFETs, results in much better electrostatic control of the channel and thus better electrical characteristics than planar FETs.

FinFETs are the basis for modern nanoelectronic semiconductor device fabrication. Microchips utilizing FinFETs became commercialized in the first half of the 2010s, and became the dominant gate design at 14 nm, 10 nm and 7 nm process nodes. It is common for a single FinFET transistor to contain several fins, arranged side by side and all covered by the same gate, that act electrically as one, to increase drive strength and performance.

This report studies the FinFET process wafer foundry. Currently only few players can provide the wafer foundry services of FinFET process.

The global FinFET Wafer Foundry market size is projected to grow from US\$ 48940 million in 2024 to US\$ 76060 million in 2030; it is expected to grow at a CAGR of 7.6% from 2024 to 2030.
