Finger condyle locking plate is an orthopedic implant used for the treatment of finger fractures. It aims to provide stable fixation for fractures involving finger joints or condyles. The finger condyle locking plate is usually made of titanium or stainless steel and has a low profile design to minimize irritation to soft tissue. It has multiple screw holes and locking screw options to securely secure the steel plate to the bone. The contour of the steel plate matches the anatomical structure of the finger joint, and there are different sizes to choose from to adapt to changes in the patient's anatomical structure. Place the steel plate on the bone surface and fix it in place with screws, which are locked in the steel plate to provide stable fixation for the fracture.
