The global Fingerprint Identification Chip for Mobile Phone market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Fingerprint recognition is the earliest application of mobile phone biometrics, and it is currently the most extensive and mature field. At present, there are three main types of fingerprint recognition technologies commonly used in mobile phones: capacitive, optical, and ultrasonic. The principle of the sensor is to use the height of the fingerprint to form different capacitance values ??depending on the distance from the sensor. The fingerprint information can be obtained by measuring these capacitance values, and then the fingerprint information is converted into an electrical signal so that the mobile phone can recognize it. At present, most of the fingerprint recognition modules on our mobile phones are based on capacitive type.

According to our Semiconductor Research Center, in 2022, the global semiconductor equipment was valued at US$ 109 billion. China mainland, China Taiwan and South Korea have a combined market share over 70%. North America, Europe and Japan, have a combined market share of 23%. The key drivers are high performance computing, AI, cloud computing, Servers, 5G and EV (electric vehicle), etc.
