The global Fire Door Electromagnetic Release Unit market size is predicted to grow from US\$ 212 million in 2025 to US\$ 328 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

In 2025, global production of fire door electromagnetic release units reached 5.16 million units, with an average selling price of \$42 per unit. A fire door electromagnetic release unit serves to hold a fire door in the open position during normal operation, thereby facilitating passage in high-traffic environments such as hospitals, office buildings, hotels, and airports. However, should the fire alarm system activate or the power supply be interrupted, the device immediately releases the door; under the action of a door closer, the door automatically shuts, thereby restoring the fire compartmentation and smoke separation barriers. Fire door electromagnetic release units are primarily utilized in fire door systems requiring the functionality of being 'held open during normal times, but closed during a fire alarm.' Typical application scenarios include hospitals, offices, cinemas, airports, hotels, factories, schools, corridor traffic hubs, and commercial complexes. The upstream segment of the value chain primarily encompasses components such as electromagnetic coils, iron cores/armature plates, die-cast metal or engineering plastic housings, springs and ball-joint adjusters, wiring terminals, power modules, surface coatings, and fasteners. The midstream segment involves the design, assembly, certification, and channel sales of the electromagnetic fire door holder units themselves. The downstream segment connects to fire doors, door closers, fire alarm systems, smoke detection systems, access control/building management systems, and commercial building fire protection engineering projects. Gross margins typically range between approximately 25% and 40%.
