According to our LPI (LP Information) latest study, the global Fire log market size was valued at US\$ million in 2023. With growing demand in downstream market, the Fire log is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Fire log market. Fire log are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Fire log. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Fire log market.

A firelog is a manufactured log constructed to be used as wood fuel. Firelogs are designed to be inexpensive, while being easier to ignite, and burn longer, and more efficiently than firewood. Firelogs are traditionally manufactured using two methods. The first uses only compressed sawdust and the second uses sawdust and paraffin, which is mixed and extruded into a log shape. The extruded firelogs are individually wrapped in paper packaging which can be ignited to start burning the firelog as the paraffin is readily combustible. A new cleaner firelog has now been developed using waste fiber from the oil palm fruit bunches of South East Asia. Unlike sawdust logs these burn with zero sulfur emissions. Also unlike sawdust logs no trees need to be felled to produce these firelogs, meaning more oxygen and less carbon dioxide in the atmosphere. The same is applicable for another new type of firelogs made from renewable Greek cotton plants, offering a high energy contents. Another new type of firelog is made from waste wax-cardboard such as that used in the packing of perishable foods for shipment, which

is used to create a compressed cardboard firelog. The materials used for a traditional firelog are variable, the sawdust used is often commercial wood waste from manufacturers, or waste agricultural biomass; additionally bio-wax may be used in lieu of paraffin.
