## Abstracts

The global Fire Safety IoT Management System market size is predicted to grow from US\$ 2192 million in 2025 to US\$ 4861 million in 2032; it is expected to grow at a CAGR of 12.4% from 2026 to 2032.

A Fire Safety IoT Management System is a digital fire management system based on IoT technology that enables real-time online monitoring, remote management, and early warning analysis of various fire protection facilities and fire risk factors within a building or park. This system connects to front-end devices such as smoke detectors, heat detectors, combustible gas detectors, fire water pressure/level detectors, and electrical fire monitoring devices, uploading operational status and abnormal data to the platform in real time to achieve hazard warnings, fault alarms, and operation and maintenance supervision. The fire protection IoT monitoring system transforms the traditional 'post-incident response' fire management model into 'pre-incident perception and proactive prevention,' serving as a core foundational system for smart fire protection and the digital upgrade of building fire protection.

The fire safety IoT management system is evolving from 'single hardware networking' to a 'full-process, full-scenario management platform.' Driven by policy initiatives, infrastructure upgrades, and digital transformation, traditional fire protection facilities and sensors are gradually being connected to the IoT network, enabling real-time data collection and risk warning. Simultaneously, centralized monitoring based on cloud platforms and big data analytics makes hazard identification, equipment status monitoring, alarm linkage, and emergency dispatch more intelligent, significantly improving the visibility and response efficiency of fire safety management. With technological maturity and improved standards, fire safety IoT not only meets compliance requirements but also becomes a crucial node in urban safety operation

and smart city construction.

From the market demand side, smart city construction, strengthened building safety supervision, and the growth of socialized fire protection services have collectively expanded the application scope of fire safety IoT systems. The increasing demand from governments, communities, industrial parks, property management companies, and other stakeholders for real-time monitoring, risk prediction, accountability, and visualized supervision is driving the rapid iteration of software services such as SaaS platforms, AI monitoring algorithms, and mobile management tools. The future market will place greater emphasis on platform interconnectivity, data fusion capabilities, and sustainable operational value; safety operation services and closed-loop management capabilities will become the core of industry competition.
