The global Fire Windows and Doors market size is predicted to grow from US\$ 2158 million in 2025 to US\$ 3032 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

Fire doors are built with special materials designed to be fire-resistant. They look like regular doors, but often have windows in them. The windows must be made with a special kind of fire-resistant glass, and often have mesh wiring inside them to prevent the windows from shattering¹. Fire-resistant windows may include mesh glass, liquid sodium silicate, ceramic glass, or borosilicate glass. Fire doors can be made with a combination of timber, steel, gypsum, and aluminium.

Fire poses a major hazard to any type of property, be it commercial, residential or industrial. When it comes to safeguarding these spaces, making use of a fire extinguisher is important, but it also has certain limitations.

Hence, it is prudent that efficient fire strategies must be in place to protect the occupants of the residential or commercial property as well as vital belongings, equipment or important documents. Alongside using the typical detection mechanisms like smoke detectors and fire alarms, one also needs to consider a fire rated door. Fire doors, which storm, will guard your premises, guaranteeing that the fire doesn't spread, but instead is delimited to one area.
