The global Fish Compound Premix market size is predicted to grow from US\$ 1094 million in 2025 to US\$ 1686 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

In 2025, global production of fish compound premix reached approximately 512,800 metric tons, with an average selling price of around USD 2,180 per ton. Fish compound premix is an aquafeed intermediate product that builds upon basic vitamin and mineral premixes by incorporating additional functional nutritional components. It is primarily used in the production of formulated feeds for freshwater and marine fish. Added at relatively low inclusion rates, fish compound premixes not only fulfill essential nutritional requirements but also enhance growth performance, feed efficiency, and environmental adaptability, serving as a key element in the transition toward more efficient and precision-oriented aquaculture feed systems.

At present, the fish compound premix market is experiencing steady expansion, with demand closely linked to global fish farming output, increasing stocking densities, and ongoing feed formulation upgrades. Market conditions indicate that key participants include international aquaculture nutrition companies, large feed groups, and regional suppliers with strong technical capabilities, while downstream customers place greater emphasis on overall performance and formulation compatibility than on basic premixes. In terms of trends, rising environmental complexity and farming risks are driving enhanced functionality in stress resistance, gut health, and nutrient utilization, while the product category remains clearly differentiated from pharmaceuticals and animal health products. Market perspectives suggest that fish compound premix represents a mid-to-high value segment with moderate technological barriers and growth potential exceeding that of basic premixes but below that of specialized functional additives.
