The global Fish Evisceration Machine market size is predicted to grow from US\$ 378 million in 2025 to US\$ 652 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

A fish viscera removal machine is a specialized automated device used in the initial processing of fish. Its main function is to quickly and stably separate and remove the internal organs (such as viscera clumps, gill residue, blood, etc.) from fish after slaughter or gutting. This equipment typically combines mechanical scraping, negative pressure suction, or rotary cleaning structures to achieve high-efficiency, low-pollution viscera processing while ensuring the integrity and appearance quality of the fish. Fish viscera removal machines are widely used in seafood processing plants, frozen food companies, and seafood export processing bases. They are essential equipment for improving processing efficiency, reducing reliance on manual labor, and meeting the requirements of food hygiene and large-scale production. Sales in 2025 were 219,000 units, with an average price of US\$1,685 per unit. Total production capacity was 250,000 units, with a gross profit margin of 40%.

With the expansion of aquaculture and the increasing standardization of the supply chain, traditional manual fish viscera removal methods face problems such as low efficiency, difficulty in hygiene control, and high labor costs. Fish viscera removal machines, as an important entry point for automation in the processing industry, can significantly improve processing speed, stability, and on-site hygiene levels, better meeting the demands of modern aquatic product processing enterprises for food safety, batch production capacity, and consistent quality. In export-oriented markets, cold chain processing centers, and large-scale integrated aquatic product production enterprises, this type of equipment is becoming a key investment to accelerate production line

transformation and product quality improvement.

Future market growth will no longer rely solely on single-machine sales, but will instead create new value spaces around ?equipment capabilities + by-product resource utilization + digital and intelligent operation.? On the one hand, while efficiently removing viscera, it provides a stable input for the standardized recycling of byproducts such as fish oil and fishmeal, thereby increasing the overall added value of processing. On the other hand, with the integration of intelligent sensing, automatic control, and industrial internet technologies, fish viscera removal machines are gradually becoming network-connected processing nodes, enabling production data collection, status monitoring, and remote optimization. These intelligent manufacturing attributes not only enhance the competitiveness of individual machines but also provide a new growth engine for integrating the supply chain, optimizing production plans, and reducing operating costs, giving them a longer-term market potential in the construction of smart factories and green processing systems.
