Fish friendly pump, also known as a fish-friendly turbine or fish-friendly water intake system, is a type of pump or water intake system designed to minimize harm or mortality of aquatic species during water extraction or pumping operations. It is specifically designed to prevent fish and other aquatic organisms from being drawn into the pumping equipment or harmed by shear forces.

Fish-friendly pumps typically incorporate features such as fine screens, fish bypass channels, special impeller designs, or protective barriers to divert or prevent fish from entering the pump. These design elements help to minimize fish entrainment, injury, or mortality, ensuring the protection of aquatic ecosystems and complying with environmental regulations.

Fish-friendly pumps or water intake systems are often used in water infrastructure projects, including hydroelectric power plants, water supply systems, irrigation networks, and industrial facilities with water extraction needs. They aim to achieve sustainable water management by reducing the impact on fish populations and promoting the conservation of aquatic species and their habitats.
