A five-axis 3D surface profiler is an instrument that combines a five-axis motion system with 3D measurement technology for high-precision, omnidirectional three-dimensional topography measurement and analysis of object surfaces. Typically, the instrument consists of a high-precision five-axis displacement stage (including XYZ displacement axes, yaw rotation platforms, etc.), a measuring probe or optical measurement system, a data acquisition and processing system, and control software. It can adjust the measurement angle across multiple degrees of freedom to conduct comprehensive measurements of complex-shaped object surfaces and obtain three-dimensional topography data.
