The Fixed Ceramic Vacuum Capacitor is a passive electronic component that employs a high-permittivity ceramic dielectric within a vacuum-sealed enclosure to achieve low-loss, high-stability capacitance. Its core structure consists of metallized ceramic layers, a vacuum-tight housing, and fixed electrodes, where the sintered ceramic dielectric forms a dense layer to suppress electric field concentration and partial discharge. This capacitor exhibits high voltage resistance, excellent temperature stability, and broad frequency response, making it suitable for energy storage and impedance matching in RF circuits, power amplifiers, and precision signal processing systems, particularly in vacuum electronic devices requiring low dielectric loss and high reliability.
