A rangefinder is a radio navigation device that measures the slant distance between an aircraft and a ground transponder. It consists of an airborne interrogator and a ground answering station. A method of determining the distance between the two by measuring the time it takes for radio waves to travel back and forth from an aircraft to a radio station. In aviation, the pulse wave near 1000MHz is used to inquire and answer, and its working distance is about 500km, which is used on the air route. In addition, in order to cooperate with the microwave landing system during approach and landing, a precision

range finder has been developed, which uses the waveform of the pulse front with a faster rising rate to improve accuracy, and its operating distance is about 40km. The working frequency of the two range finders is the same, so they can work compatible.
