A flame resistant lab coat is a specialized protective garment designed to safeguard individuals working in environments where there is a risk of exposure to flames, heat, and other fire - related hazards. These lab coats are crafted from materials with inherent flame - retardant properties or treated with chemicals that prevent or slow down the spread of fire. For instance, they may be made from aramid fibers like Kevlar, which can withstand high temperatures without melting or dripping, or from modacrylic fibers that self - extinguish when the source of the flame is removed. Flame resistant lab coats are essential in various industries, including chemical manufacturing, metalworking, and research laboratories handling flammable substances. They typically feature secure closures, such as zippers or buttons, and may have additional design elements like cuffed sleeves to prevent flames from entering and protect the wearer's arms. By providing a barrier against fire and heat, flame resistant lab coats significantly reduce the risk of burn injuries, ensuring the safety and well - being of those working in potentially dangerous conditions.
