The global Flapper Nozzle Electro-hydraulic Servo Valve market size is predicted to grow from US\$ 214 million in 2025 to US\$ 261 million in 2031; it is expected to grow at a CAGR of 3.3% from 2025 to 2031.

Nozzle flapper type force feedback electro-hydraulic servo valve is a two-stage electro-hydraulic servo valve with a large amount of use and a wide range of applications. It consists of three parts: torque motor, nozzle baffle type hydraulic preamplifier stage and four-side slide valve power amplifier stage. Flapper Nozzle Electro-hydraulic Servo Valve is small in size and weight, stable in performance and high in reliability, and can be widely used in various hydraulic control systems.

An electro-hydraulic servo valve is a device used to control a hydraulic system, which converts electrical signals into hydraulic signals, thereby achieving precise control of hydraulic actuators such as hydraulic cylinders or hydraulic motors. Electro-hydraulic servo valves are used in many industrial applications to achieve high-precision, high-performance motion control, such as construction machinery, aerospace, and automated production lines. The control system controls the operation of the electrohydraulic servo valve through an electrical signal (usually a voltage signal). This signal can come from an automated control system, computer control or other control equipment. The electro-hydraulic servo valve contains a spool inside, and when an electrical signal is input, it will be moved to change the opening size of the liquid flow channel. The position of the spool determines the speed and pressure of the liquid through the valve. Changes in the position of the spool cause changes in the flow of fluid in the valve, thereby adjusting the movement of the hydraulic actuator (hydraulic

cylinder or hydraulic motor). By controlling the position of the spool, precise speed and position control can be achieved.
