For a long time, oil producers have simply flared associated petroleum gas (so called "flare gas"), considered an unwanted oil by-product. But with increased energy demand coinciding with an escalation in environmental consciousness — flaring now often is avoided, and sometimes even prohibited. Flare-to-Hydrogen technology converts environmentally harmful flaring gases right at the flare of an oil production field to clean hydrogen and solid carbon. As flare gas compositions vary in a wide range, the process filters out pure methane CH<sub>4</sub>, which reacts in the methane pyrolysis process to hydrogen and solid carbon.

The global Flare-to-Hydrogen market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
