## Abstracts

The global Flash Spinning HDPE Nonwovens market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Flash-spinning is a novel method for preparing plexifilamentary film-fibril strands from fiber-forming polymers. In this process, the polymer was dissolved in a solvent, which was a non-solvent for the polymer at or below its normal boiling point, at a temperature above the normal boiling point of the solvent. Then the solution was extruded into a region of substantially lower pressure and temperature. The superheating temperature caused the solvent to vaporize and thereby the extrudate was cooled to form a plexifilamentary film-fibril strand of the polymer.

Flash-spinning HDPE nonwoven is a special fiber material made of high-density polyethylene material by flash steaming. It has the characteristics of strong waterproofness, breathability, light weight, high strength, anti-bacteria, and high cleanliness.

United States market for Flash Spinning HDPE Nonwovens is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
