A 'flashlamp power supply' is a device designed to provide the high voltage and energy needed to discharge a flashlamp, which is a type of gas discharge lamp used to produce short bursts of intense light. Flashlamp power supplies typically consist of circuits that convert low-voltage DC or AC power from a mains source into high-voltage pulses suitable for triggering and powering the flashlamp.

These power supplies often incorporate components such as capacitors, transformers, trigger circuits, and voltage regulators to generate the necessary electrical pulses and control the timing and duration of the flash. They are commonly used in various applications, including flash photography, laser pumping, industrial processing, and medical equipment such as laser dermatology devices and laser-based surgical tools.

The global Flashlamp Power Supplies market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
