A flexible electrochromic display is a type of electronic display technology that can change its color or opacity in response to an electrical signal. These displays consist of multiple layers of flexible materials, including electrodes, electrolytes, and electrochromic materials, sandwiched between two flexible substrates. When a voltage is applied, ions are transported between the layers, causing a reversible change in color or transparency. Flexible electrochromic displays offer advantages such as low power consumption, high contrast, wide viewing angles, and the ability to conform to curved or irregular surfaces. They are used in various applications, including e-readers, smart labels, wearable devices, and smart windows, where flexibility and low-power operation are essential requirements.

The global Flexible Electrochromic Display market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
