A flexible flanged coupling is a mechanical device used to connect two shafts together, allowing for the transmission of torque while accommodating misalignment, vibration, and thermal expansion. It consists of two flanged hubs that are bolted together with a flexible element in between. The flexible element, typically made from materials such as rubber, elastomer, or metal, absorbs shocks and compensates for slight angular, parallel, or axial misalignment between the connected shafts. This type of coupling is commonly used in various industrial applications, including pumps, compressors, and conveyors, where flexibility and durability are essential for maintaining smooth and efficient operation.
