Flexible implantable electrodes are flexible electrodes, usually made of bendable materials (such as polymers or flexible metals), that can fit closely to biological tissues and reduce damage to tissues. Such electrodes are widely used in medical fields such as neural stimulation, brain-computer interfaces, and electromyography monitoring. They can be implanted in the body for a long time or permanently to accurately record and stimulate nerves, muscles, or other biological signals. Their flexible properties enable them to adapt to complex biological environments and improve the contact stability and signal transmission efficiency between electrodes and tissues.
