The global Flexible Interdigitated Electrodes market size is predicted to grow from US$ 47.9 million in 2025 to US$ 59 million in 2031; it is expected to grow at a CAGR of 3.5% from 2025 to 2031.

?Flexible interdigitated electrode? is a new type of electrode structure, which is composed of silver wires. Each end is connected to a biplane interdigitated interdigital finger, which can be equivalent to a sliding contact. When an external voltage is applied to the electrode, because its interdigitated biplane cross structure has a certain degree of elasticity, it can undergo slight deformation under the action of external force, thereby changing its electrical parameters and achieving signal detection and amplification.
