A flexible negative pressure suction sheath is a medical device component used in endoscopic or minimally invasive procedures to provide a flexible suction channel connected to an external vacuum source. It enables continuous or intermittent removal of fluids, blood, or tissue debris. Typically made of medical-grade polymer materials, it offers high flexibility and structural stability, allowing operation within narrow or curved anatomical pathways while maintaining suction efficiency and tissue safety. The structure generally includes a flexible sheath body, connector interface, reinforcement layer, and anti-collapse design.

Upstream includes medical-grade polymers such as TPU, PE, and PTFE, braided reinforcement materials, connector components, and precision extrusion processes. Downstream applications include hospital endoscopy centers, surgical operating rooms, and minimally invasive interventional procedures. The overall industry gross margin generally ranges from 40% to 65%, with higher margins for sterile disposable and advanced structural designs.

The global production of flexible negative pressure suction sheaths is projected to reach 210,000 units by 2025, with an average price of \$260 per unit.
