The global Flexible Photovoltaic Modules market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Flexible photovoltaic modules are lightweight and bendable solar panels that offer versatility in installation and applications compared to traditional rigid solar panels. These modules are typically made using thin-film solar cell technologies, such as amorphous silicon (a-Si), cadmium telluride (CdTe), or copper indium gallium selenide (CIGS), deposited onto flexible substrates such as plastic or metal foils. This flexibility allows them to conform to curved or irregular surfaces, making them suitable for integration into building materials, vehicles, portable electronics, and other applications where rigid solar panels would be impractical.

There are two types of flexible photovoltaic modules: thin-film photovoltaic modules with the photovoltaic material printed onto a flexible surface and a crystalline silicon option with very thin silicon wafers that have some bendability. Currently, crystalline silicon photovoltaic modules are more common.

Flexible photovoltaic modules offer advantages in terms of reduced weight, easier transportation and installation, and the ability to generate electricity in diverse environments and conditions.

United States market for Flexible Photovoltaic Modules is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
