A flexible transparent film heater is a type of heating element that consists of a thin, transparent film made of conductive material deposited on a substrate such as plastic. When an electric current is passed through the conductive film, it generates heat which is transferred to the surrounding environment. The transparency of the film allows for easy integration into various applications where visibility is important, such as automotive windows, displays, and smart mirrors. Transparent film heaters have several advantages over traditional heating technologies such as faster response time, lower power consumption, and greater design flexibility.

The global Flexible Transparent Film Heater market size is projected to grow from US\$ 35 million in 2024 to US\$ 42 million in 2030; it is expected to grow at a CAGR of 3.1% from 2024 to 2030.
