The global Flight Communication System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Flight communication systems refer to communication equipment and systems on aircraft, helicopters and other aircraft used to communicate with ground control centers, other aircraft and ground equipment. The flight communication system includes the following aspects:

Radio communication system: Used for voice communication with air traffic control, weather information centers, airlines and other aircraft during flight.

Datalink communication system: used to communicate data with ground control centers and other aircraft during flight, such as transmitting meteorological information, aircraft position and trajectory.

Satellite communication systems: used to communicate in areas where there is no terrestrial communications infrastructure, such as on the ocean and in the polar regions.

Emergency communication system: includes emergency broadcast and emergency call system for communicating with ground control centers and other aircraft in the event of an emergency in flight.

The main function of the flight communication system is to ensure that the aircraft can communicate with the ground control center, other aircraft and ground equipment during the flight to ensure the safety and smooth flight. In the modern aviation industry, flight

communication systems have become a very important technical field. With the continuous advancement and innovation of science and technology, the functions and performance of flight communication systems are also constantly improving, making important contributions to the development of the air transport industry.

The Global Mobile Economy Development Report 2023 released by GSMA Intelligence pointed out that by the end of 2022, the number of global mobile users would exceed 5.4 billion. The mobile ecosystem supports 16 million jobs directly and 12 million jobs indirectly.
