The global Flight Situational Awareness Solution market size is predicted to grow from US$ 4492 million in 2025 to US$ 7302 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

Flight Situational Awareness Solution refers to the continuous collection and fusion of information such as aircraft position, attitude, altitude, flight path, surrounding traffic, terrain obstacles, weather, and airspace restrictions through airborne sensors, avionics, navigation and surveillance systems, terrain and obstacle databases, aviation meteorological data, and air-to-ground communication networks. This generates a unified, intuitive, and real-time view of the flight environment for pilots, air operations control centers, or air traffic management personnel. It also provides tiered alerts and decision support when collisions, controlled flight into the ground, runway incursions, hazardous weather, or flight path deviation risks are identified.

Flight situational awareness solutions are shifting from independent warning devices to a comprehensive situational awareness architecture that integrates multiple sensors, cross-platform capabilities, and air-ground collaboration. The next-generation system fuses data from ADS-B, weather radar, infrared and visual sensors, terrain databases, satellite navigation, flight management systems, and electronic flight bags, utilizing artificial intelligence to identify traffic conflicts, hazardous weather, runway incursions, and abnormal flight paths. Synthetic and augmented vision are being rapidly adopted in low-visibility flight, helicopters, and business aviation; software-based airworthiness certification, open avionics architecture, and modular upgrades will reduce the cost of retrofitting older fleets. Meanwhile, SWIM, trajectory tracking, and cloud-based aviation data services are driving the sharing of unified situational information among airborne systems, airline operations centers, and air traffic control systems. Land, Infrastructure, Transport and Tourism has also identified the sharing of ADS-B inter-aircraft awareness, airborne meteorological information, and real-time SWIM information as important directions for improving aviation safety and decision-making efficiency.
