The report requires updating with new data and is sent in 48 hours after order is placed.

Float Traps perform continuous evacuation, especially with the amount of condensate, at the steam saturation temperature. It is not affected by sudden and wide pressure changes. Rather, it is preferred for systems where condensate desorption is desired to be rapid, where condensation accumulation in the pipeline is

undesirable. Ideal for automatic temperature control systems.

In addition to the float performing the evacuation mission, the air evacuation is also carried out by the bimetallic plates present in the body. Thus, water hammer is prevented which is caused by air deposit in the pipeline. At the same time, if the float loses its function for any reason, the bimetallic plate enters the circuit to continue the condensate removal and prevents the system from becoming blocked.
