Float glass mirror refers to a type of mirror made using a manufacturing process called the float glass method. In this process, molten glass is poured onto a bed of molten metal (usually tin), creating a flat, uniform sheet of glass. This method produces high-quality glass with excellent optical clarity and smoothness. Once the glass has solidified, it undergoes various treatments to become a mirror. Typically, one side of the glass is coated with a thin layer of reflective material, such as silver or aluminum, followed by a layer of protective paint to prevent damage to the reflective coating. This creates the reflective surface of the mirror. Float glass mirrors are widely used in residential and commercial settings for various applications, including bathrooms, dressing rooms, gyms, and decorative purposes. They offer clear and distortion-free reflections due to the high-quality glass and reflective coatings used in their production.

The global Float Glass Mirror market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
