The float water level gauge is a traditional and widely used water level measurement device with a simple principle and reliable structure. It is suitable for monitoring the liquid level of various liquid containers and water bodies. The float water level gauge operates based on the principles of buoyancy and gravity. When the liquid level changes, the float rises and falls with the liquid surface, driving the connected mechanical or electronic device to convert the liquid level height into a pointer display, electronic signal or data output. The main components include float, guide rod (or guide rail), measuring mechanism (such as sliding resistor, encoder), etc.
