The global Floating Covers market size is predicted to grow from US\$ 1073 million in 2025 to US\$ 1489 million in 2031; it is expected to grow at a CAGR of 5.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Floating covers are geo-synthetic covers that are placed over ground ponds to prevent pollution of the liquid being stored from outside sources, such as animal waste, which can reduce the portability of water, evaporate the liquid being trapped, and remove offensive odours that can reduce the release of volatile organic compounds.

Mulches are increasingly used to protect water from evaporation, algae, odors and other external pollutants due to their increased strength, affordability, light weight, excellent UV resistance and other desirable qualities. The demand for this product is constantly increasing. Key features of floating coverings include good thermal insulation, simple, adaptable design, low maintenance needs, simple installation, odor control, easy conversion to a biogas collector system, resistance to wind lift, puncture and tear resistance, UV resistance, protection against pollution and algae growth, and evaporation control. Moreover, rapid urbanization and rising demand for technologically advanced products such as reinforced PVC floating covers will further drive the growth of the floating covers market. Expansion of various end-use industries will drive market value growth.
