The global Floating Gate Flash Technology market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Floating Gate Flash Technology, also known as floating gate flash technology, is an important technology widely used in non-volatile memories (such as NAND and some NOR flash memories). Floating Gate Flash Technology uses floating gate transistors as storage units. The floating gate is a floating gate made of a layer of semiconductor material, which is wrapped by an insulating layer and electrically isolated from the outside world. This layer of floating gate can capture and store charges, and realize data writing, reading and erasing operations by controlling the storage and release of charges.

Floating Gate Flash Technology, also known as floating gate flash technology, is a technology widely used in the early days of NAND flash memory and some NOR flash memory. It uses a floating gate structure to store charge and thus record data. However, with the advancement of technology and cost considerations, Charge Trap Flash (CTF) technology has gradually dominated the field of NAND flash memory, especially in the field of 3D NAND. Despite this, Floating Gate technology still maintains its application in certain specific fields, such as some enterprise-level SSDs and markets with special needs. Micron, Intel and other companies have continued to use Floating Gate technology for a period of time, believing that its data retention and anti-read and write interference capabilities are stronger, which is particularly important for enterprise-level users. In summary, the position of Floating Gate Flash Technology in the NAND flash memory market has gradually declined, but it still maintains a certain application space.
